

# Symforce Tutorial

Notebook ini adalah tutorial untuk menggunakan Symforce. Tutorial ini akan membahas tentang:

- Instalasi Symforce menggunakan pip via bash command
- contoh sederhana pemodelan dan penyelesaian masalah pengoptimalan dengan SymForce. Dalam contoh ini robot bergerak melalui bidang 2D dan tujuannya adalah untuk memperkirakan posenya pada beberapa langkah waktu dengan pengukuran kebisingan.

```
In [26]: %%bash
         pip install symforce
```

## Generate C++ Code

Untuk setiap faktor, SymForce mengintrospeksi bentuk fungsi simbolik, melewati input simbolik untuk membuat ekspresi output, secara otomatis menghitung jacobian ruang-singgung dari ekspresi output tersebut dengan variabel yang dioptimalkan, dan menghasilkan kode runtime cepat untuk variabel tersebut. Class Codegen adalah alat utama untuk menghasilkan kode runtime dari ekspresi simbolik. Dalam hal ini, kami meneruskan fungsi sisa bantalan dan mengonfigurasinya untuk menghasilkan kode C++:

```
In [15]: from symforce.codegen import Codegen, CppConfig

         codegen = Codegen.function(bearing_residual, config=CppConfig())

In [16]: codegen_linearization = codegen.with_linearization(
         which_args=["pose"]
         )
         import warnings
         warnings.filterwarnings("ignore")
```

```
In [ ]: metadata = codegen_linearization.generate_function()
# with open('coba.cpp', 'w') as f:
#     f.write(metadata.generated_files[0])
#     f.close()
# with open(metadata.generated_files[0]).read() as f:
#     lines = f.readlines()
#     lines = [l for l in lines if "ROW" in l]
#     with open("out.txt", "w") as f1:
#         f1.writelines(lines)
# print(type(metadata.generated_files[0]))
code=open(metadata.generated_files[0]).read()
with open('coba.cpp', 'w') as f:
    f.write(code)
# print(open(metadata.generated_files[0]).read())
```

```
